

# Stage 2 — AI Processing

Classify and rename every document with AI, then organise each worker's folder into Overwrite Documents + Bulk batches, ready to upload.

STAGE 1 · Download &amp; Merge

STAGE 2 · AI Processing

STAGE 3 · Uploading

## 1 What Stage 2 does

**Stage 2 reads every document with AI, renames it to a controlled compliance type, and organises each worker's folder ready for upload.** For every document it sends page images + extracted text to Claude, which matches it against the controlled vocabulary (Passport, BRP, Certificate of Sponsorship, DBS Document, Share Code Check Result, UK/Non UK Driving Licence, and dozens more). Then a **second pass** per worker:

- **Duplicates** — byte-identical copies removed, one kept.
- **Dating** — Certificates of Sponsorship and Share Code Check Results get their real document date read and appended: `Certificate of Sponsorship - (29-05-2025).pdf`.
- **Ranking** — when a type has several different copies they're ranked `(01)`, `(02)` ... so the best/newest ends up on top at upload time.
- **Organising** — files are split into `Overwrite Documents` (the controlled types Stage 3 uploads individually) and `Bulk\Batch NN` (everything else, 30 per batch).

Unrecognised documents become `Other - <description>.pdf`; anything the AI can't identify at all is auto-re-checked and, failing that, left as `Other - Unknown`. A content-hash cache means **the same document is never billed twice**, even across runs.

## 2 Folder setup for Stage 2

```

Documents > Lifted > Bluebird Cheshire
├─ Bluebird Cheshire [Files]      ← Stage 1 output – Stage 2's INPUT
└─ Bluebird Cheshire [Processed] ← create this – finished workers move here
  
```

### SET-UP CHECKLIST

1. Create `<Care Home> [Processed]` beside the `[Files]` folder.
2. In Stage 2's ⚙️ **Settings** → **File movement**, tick *Move processed workers to a destination folder* and pick the `[Processed]` folder. Each worker folder then moves there the moment it finishes — so `[Files]` always shows what's left and `[Processed]` is exactly what Stage 3 uploads. Workers already in the destination are skipped on a re-run.

Also one-time: the installer stores the Anthropic API key in Windows Credential Manager and installs LibreOffice (used to convert Office files to PDF).

## 3 Two processing modes

### Live mode

Classifies one document at a time while you watch — live preview, running £ cost meter, and (unless Auto-Other is on) a dialog for unrecognised documents so you can name them on the spot. The app must stay open and online for the whole run.

### Overnight Batch mode — 50% of the price

Submits every document to the API's batch queue in one go, then you can **close the app**. Results are usually ready within an hour (up to 24h). Re-open, press ⌚ **Check batch status**, and the results are downloaded and applied — same renaming logic, byte-for-byte. Unknowns are auto-re-checked individually (with a stronger second-opinion model when confidence is low), and the dating/ranking second pass runs live at standard price. A hidden state file in the care-home folder tracks the pending batch; the app offers to resume it whenever you re-open that folder.

### WHICH MODE?

Batch for big folders and overnight runs — half price, zero babysitting. Live when you want to name unknowns yourself as they appear, or need results immediately. The confirmation screen shows a side-by-side cost estimate for both before you commit.

## 4 Running Stage 2, step by step

### 1 Choose the care-home folder

Launch `Stage 2 - Processing.exe` → 📁 **Choose care-home folder** → select `<Care Home> [Files]`.  
The app scans it and shows what it found.

### 2 Read the confirmation screen

Before anything is billed you get: worker/file counts, lists of files that will be skipped (oversized, cloud-only placeholders, already processed), an **estimated cost for Live vs Overnight Batch** with the second-pass estimate, estimated time, and your safety limits. Pick the **processing mode** here.

### 3 Let it run

**Live:** watch the preview, log and cost meter: unrecognised documents pop the “Define this document” dialog — type what it is and press **Relevant** (a real compliance type) or **Other** (miscellaneous). The AI remembers your answer for next time. **Stop run** ends safely.

**Batch:** the app submits and tells you it's safe to close. Later: open the folder again → ⌚ **Check batch status** → results download and apply, unknowns auto-resolve, second pass runs, workers move to `[Processed]`.

### 4 Check the result

Each worker folder now contains only `Overwrite Documents` + `Bulk`, with clean controlled names — and has moved to `[Processed]`. The end summary shows renamed / unknown / duplicate counts and estimated vs actual cost.

📁 Brenda

↳ 📁 Overwrite Documents

↳ BRP.pdf

↳ Certificate of Sponsorship - (29-05-2025).pdf

↳ eVisa Screenshot.pdf

↳ Share Code Check Result - (23-01-2026).pdf

↳ 📁 Bulk

↳ 📁 Batch 01

↳ DBS Check.pdf

↳ Employment Contract.pdf

↳ Health Declaration.pdf

↳ Other - reference request email.pdf

← after Stage 2 (now inside [Processed])

← uploaded one-by-one by Stage 3, types set

← bulk-uploaded 30 at a time

## 5 Buttons & extra tools

📁 Choose care-home folder

▶ Start processing

📁 Flatten folders only

⌚ Check batch status

⚙ Settings

| Control                                            | What it does                                                                                                                                                                                                                                                                                                   |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flatten folders only                               | Just pulls nested files up into each worker folder — no AI, no cost. Handy after manually adding files.                                                                                                                                                                                                        |
| Check batch status                                 | Polls a pending overnight batch; applies results when ready; also lets you cancel one (already-processed items stay billed).                                                                                                                                                                                   |
| API usage page                                     | Inside Settings — shows spend per app/model over time.                                                                                                                                                                                                                                                         |
| Re-check Unknowns & Tidy<br>(separate desktop app) | Run it after Stage 2 on a processed folder: deletes every worker sub-folder except Bulk / Overwrite Documents (documents inside are rescued first, never deleted) and re-classifies every Other - Unknown with the same AI — moving anything that turns out to be an overwrite type into Overwrite Documents . |

## 6 Settings reference (⚙)

| Setting                                 | Effect                                                                                                                                                           |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Anthropic API key                       | Stored in Windows Credential Manager; "show" and "Clear stored key".                                                                                             |
| Model                                   | Haiku (cheapest, default) / Sonnet. "Show advanced models" reveals Opus. Low-confidence results are automatically double-checked by a stronger model regardless. |
| USD → GBP rate                          | Used by every cost display.                                                                                                                                      |
| Max workers / files / spend (£) per run | Hard safety stops — the run halts cleanly when any is reached.                                                                                                   |
| Skip files larger than (MB)             | Oversized files are skipped and logged, never sent.                                                                                                              |
| Image resolution                        | Render zoom for page images. Lower = cheaper; keep text readable. 1.5× is the sweet spot.                                                                        |

|                                                                        |                                                                                                                                                              |
|------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Adaptive pages</b>                                                  | Sends page 1 first and only sends the rest if the AI isn't sure — big token saving (Live mode).                                                              |
| <b>Skip the API when the filename/text already identifies the type</b> | Free classification for obviously-named files. Off by default for accuracy.                                                                                  |
| <b>Auto-file unrecognised as Other</b>                                 | Live mode never interrupts you with the Define dialog; unknowns become <b>Other - Unknown</b> for the auto-re-check.                                         |
| <b>Convert every document to PDF first</b>                             | Office/image/email files become PDFs (LibreOffice) so everything uploads consistently.                                                                       |
| <b>Redact filenames in the activity log</b>                            | Hides worker-identifying names on screen.                                                                                                                    |
| <b>File movement + destination</b>                                     | The <b>[Processed]</b> hand-off described above.                                                                                                             |
| <b>Accuracy audit after processing</b>                                 | Optional post-run re-check of every renamed file (second-model confirmed) → <b>Filename_Audit_Report.xlsx</b> . Audit only — costs about a second full pass. |

7

## Troubleshooting

| You see...                                  | It means / do this                                                                                                                                                               |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| “already processed (cached, no API call)”   | The exact same file content was classified before — renamed from the cache for free. Force a full redo by answering “re-process” when prompted on a re-run.                      |
| “STOPPED: budget/file/worker limit reached” | A safety limit hit. Raise it in Settings and run again — everything done so far is kept and cached.                                                                              |
| “API credit exhausted”                      | Top up the Anthropic account, run again; cached results mean you only pay for what's left.                                                                                       |
| “skipped: cloud-only”                       | The file is a OneDrive placeholder that isn't actually on disk. Right-click → “Always keep on this device”, then re-run.                                                         |
| A batch is pending on this folder           | Stage 2 blocks a second submission until you apply or cancel it —  <b>Check batch status.</b> |
| Wrong name on a document                    | Rename it by hand (keep the <b>Type - (date) / (NN)</b> pattern), or run the Re-check tool. Your Define-dialog answers teach the vocabulary for next time.                       |
